

Figure 1. A schematic diagram illustrating the experimental design. The figure shows a sequence of events starting from a participant's arrival at the laboratory. The participant is first informed about the experiment and then given a practice trial. This is followed by three main phases: a baseline phase, a treatment phase, and a follow-up phase. Each phase includes a pre-test, intervention, and post-test period. The baseline phase involves a pre-test, a baseline measurement, and a post-test. The treatment phase involves a pre-test, a treatment intervention, and a post-test. The follow-up phase involves a pre-test, a follow-up measurement, and a post-test. The timeline indicates that the baseline phase occurs first, followed by the treatment phase, and finally the follow-up phase. Arrows indicate the flow between these stages.
